

JobOps Product Configurator

Streamline Configuration

The JobOps Product Configurator lets you streamline how you configure custom products and services.

Speeds Job Delivery

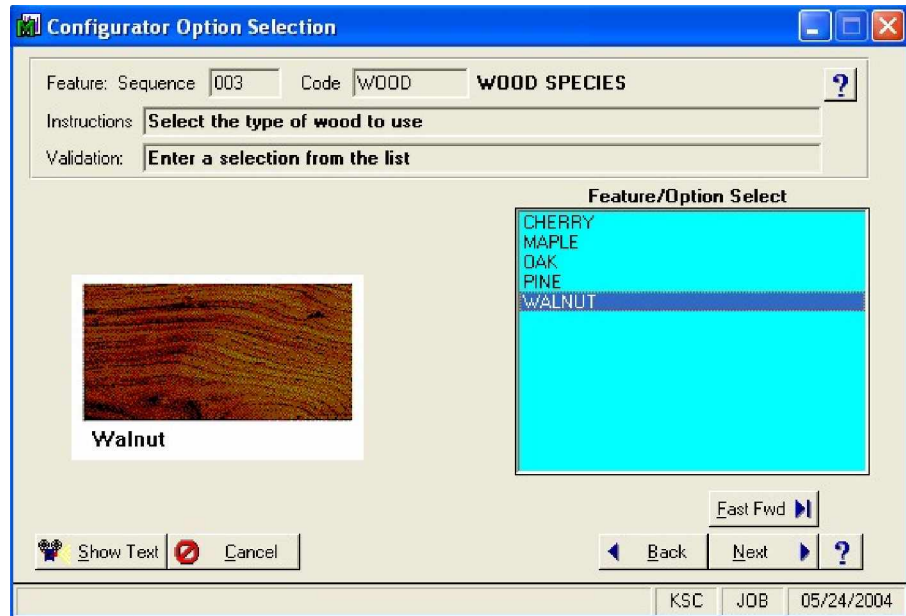

Product Configurator helps you speed up the quoting, sales order entry and creation of production orders.

Competitive Edge

By giving customers options when they order your products and letting them choose size, quantity, colors and optional components you get a competitive edge—resulting in repeat orders and customers.

Grow Business Profits

Whatever custom product or service you offer from making cabinets, installing networks for office buildings or offering custom products or services — the JobOps Product Configurator lets you quickly process orders, while growing your business and profits.

Using the Product Configurator graphical selection wizard to build a custom door you would be asked for dimensions, type of materials and paint or stain colors. For dimensions, the system relies on minimum and maximum dimensions that you offer. The Product Configurator provides a list of available options that are only available for that particular product, helping you build accurate and complete orders.

The JobOps Product Configurator is an optional module for the JobOps Management System giving users additional flexibility in offering customized products and services. How it works is through a simple graphical selection wizard tool that guides you through the process.

The Product Configurator asks simple questions needed to configure your customer's product. It is rules-based so it only presents you with the available options for that product that are compatible with options already selected. This helps eliminate the situation where you could order a door that is too narrow or selecting the wrong color of wood stain. In the end, this check and balances on available options saves you time in doing the order right the first time and increased your customer's satisfaction

Take advantage of this configuration aid to make the most of your labor, time and materials. You'll quickly see the return on your investment in JobOps and your Sage MAS 90 and 200 systems.

JobOps is a suite of Job Management modules for Sage MAS 90 and Sage MAS 200 ERP. JobOps is suited for small and mid-sized companies (\$7-50 million), in the manufacturing, installation and service/field repair areas.

JobOps Product Configurator

FEATURES

Whether you make custom cabinets or other products or services, the JobOps Product Configurator helps you streamline the process. The end result: better jobs, more profitability and increased customer satisfaction.

- **Configuration Templates**

Configuration templates that include common sets of user responses can be easily created to help save time and improve efficiency.

- **Rules-based**

The JobOps Configurator works around a series of rules that are built when the configuration is constructed. These rules determine which features are available with other features and options.

- **Price Calculation**

Price rules allow end-user pricing based on options and features selected. Optional components may be rolled into the final price or charged as separate items.

- **Ease-of-use**

It's easy to configure a custom order with our step-by-step configuration process. The system walks you through a series of questions and features, which can be a specific number (i.e. length, height or quantity) or other options selected from a list or entered as text.

- **Visual Validation**

As features and options are selected, images of the selections are displayed on screen to validate the entries as they are made.

- **Smart Part Numbers**

A "smart part" code is generated to identify the part's unique features and options and may be used internally to label a finished good.

- **Auto Build BOM**

A full Bill of Materials is generated based on the features and options selected. Raw material requirements are scaled to the quantities as well as the dimensional aspects of the configuration.

- **Auto Build Work Tickets**

Labor requirements are calculated based on the features and options selected, which results in a multi-step router that has time and cost estimates for each phase of production.

- **Web Enabled**

Through Sage e-Business Manager, the JobOps Product Configurator gives your customers and remote sales people the ability to configure their own quotes and orders over the Internet.
